# Capecitabine and temozolomide

\_\_\_\_

#### **Indication**

Metastatic/Non-resectable Neuroendocrine carcinoma/Tumour

## **Regimen details**

Capecitabine 750mg/m<sup>2</sup> orally twice daily on Days 1- 14 (2 weeks) Temozolomide 200mg/m<sup>2</sup> orally once daily on Days 10-14 (5 Days)

#### **Cycle frequency**

Every 28 days

# **Number of cycles**

6 cycles

#### **Administration**

Capecitabine should be taken after food
Temozolomide should be taken on an empty stomach
If vomiting occurs after a dose is taken, patients should not take an additional dose

#### **Pre-medication**

N/A

#### **Emetogenicity**

Low emetogenicity on days 1-14, high on 10-14

#### Additional supportive medication

Ondansetron 8mg BD on days 10-14 (i.e. with temozolomide) Metoclopramide prn

#### **Extravasation**

N/A

#### Investigations – pre first cycle

Investigation	Validity period
FBC	14 days
U+E (including creatinine)	14 days
LFT (including AST)	14 days
DPD mutation analysis	

Dihydropyrimidine dehydrogenase (DPD) deficiency can result in severe toxicity secondary to reduced fluorouracil metabolism (this can present as severe diarrhoea and/or severe stomatitis early in the first cycle). Patients require DPD testing prior to administration. Dose adjustments should be made in accordance with local DPD policy

#### Investigations -pre subsequent cycles

FBC, U+E (including creatinine), LFT (including AST)

# Standard limits for administration to go ahead

If blood results not within range, authorisation to administer must be given by prescriber/ consultant.

Investigation	Limit
Neutrophil count	$\geq 1.5 \times 10^9 / L$
Platelet count	$\geq 75 \times 10^{9}/L$
Creatinine clearance	≥ 50 mL/min
Bilirubin	≤3 x ULN
AST	< 2.5 x ULN

#### **Dose modifications**

## For haematological toxicity

At the start of each cycle

Neutrophils		Platelets	Capecitabine and temozolomide doses			
(x 10 <sup>9</sup> /L)		(x 10 <sup>9</sup> /L)	1 <sup>st</sup> occurrence	2 <sup>nd</sup> occurrence	3 <sup>rd</sup> occurrence	4 <sup>th</sup> occurrence
≥1.5	And	≥75	100%	100%	100%	100%
1-1.49	Or	50-74	Delay until	Delay until	Delay until	Discontinue
			recovery then 100%	recovery then 75%	recovery then 50%	
0.5-0.99	Or	25-49	Delay until recovery then 75%	Delay until recovery then 50%	Discontinue	Discontinue
<0.5	Or	<25	Discontinue or delay until recovery then 50%	Discontinue	Discontinue	Discontinue

#### **Renal Impairment**

Capecitabine

CrCl (mL/min)	Capecitabine dose		
>50	100%		
30-50	75% (with close monitoring)		

## **Hepatic Impairment**

Capecitabine

AST / ALT (x ULN)		Bilirubin (x ULN)	Capecitabine dose
≤ 2.5	and	≤ 3	100%
> 2.5	or	> 3	Consultant decision

Temozolomide – Caution in patients with severe hepatic impairment – discuss with consultant if bilirubin >  $3 \times ULN$  and/or AST/ALT >  $2.5 \times ULN$ 

## Other toxicities

Reduce capecitabine by 25% in the event of palmar plantar erythrodysesthesia, diarrhoea or stomatitis.

#### Adverse effects -

for full details consult product literature/ reference texts

#### Serious side effects

Cardiotoxicity
Myelosuppression
Diarrhoea
Myopathy
Thrombus/embolism

Severe toxicity due to DPD deficiency (see comments below)

## Frequently occurring side effects

Nausea and vomiting Stomatitis/Mucositis Myelosuppression PPE Fatigue Skin reactions Nail changes Taste disturbance Constipation Anorexia, weight loss Seizure, headache

#### Other side effects

Myalgia
Fluid retention
Alopecia
Rash
Deranged liver function

### Significant drug interactions

- for full details consult product literature/ reference texts

Folinates: Avoid concomitant use of folinic and folic acid – enhanced toxicity of fluorouracil.

Co-trimoxazole/trimethoprim: Avoid if possible — enhances antifolate effect. If essential, monitor FBC regularly. Warfarin/coumarin anticoagulants: Avoid use due to elevations in INR. Switch to low molecular weight heparin during treatment.

Sorivudine, Allopurinol, Phenytoin: close monitoring is necessary if prescribed with any of these agents.

Antacids: Aluminium hydroxide and magnesium hydroxide containing antacids have been shown to produce a slight increase in plasma concentration of capecitabine.

Sodium valproate - may decrease clearance of temozolomide

#### **Additional comments**

Temozolomide is contraindicated in patients hypersensitive to dacarbazine (DTIC)
